Cameron Weston

Senior Software Engineer | Full-Stack Developer | AI Code Evaluation, Agentic Coding & Red-Teaming

Seattle, WA (Remote) | 417-540-6165 | cameronbweston@gmail.com | linkedin.com/in/cameronweston | github.com/cameron-weston

Summary

Full-stack software engineer with 10 years of experience shipping production code, plus daily hands-on agentic coding with Claude Code and frontier models. I know where AI-generated code breaks: confidently wrong solutions, silent data bugs, stale async state, unsafe code that skips authorization, and faked test passes. At my last company I used AI to find bugs nobody had reported, filed them on the Azure DevOps board, then fixed, tested and merged them myself. 116 completed pull requests and 837 commits in two years. I write clear, specific bug reports that explain the failure and why it happened.

AI Code Evaluation, Agentic Coding & Red-Teaming

- **Agentic coding on real engineering tasks.** Ran Claude Code sessions (vibe coding with frontier models) to fix bugs, extend REST APIs and ship features in a large production C#/.NET monorepo, then reviewed the AI-generated code against production standards before it merged.
- **Find the bug, explain the failure, fix it.** Used AI-assisted code analysis to audit a Blazor migration against legacy behavior and surface defects nobody had reported. Documented each failure on the Azure DevOps board, then fixed, tested and merged it myself (e.g. Bugs 33388, 33595, 33597, 33292).
- **Catching confidently wrong solutions.** Found filters that silently dropped, numeric and percentage ranges that returned wrong rows, and saved dashboards that looked restored but were not. Traced each from the UI through service parsing into SQL scope.
- **Root-causing subtle failure modes.** Diagnosed integer casts crushing values, off-by-one date boundaries, race conditions where stale async results overwrote newer ones, null-reference crashes on incomplete data, and whole-table loads hidden behind a dropdown.
- **Red-teaming for unsafe code.** Found and fixed tenant-context leaks, role-permission gaps and inconsistent market-access enforcement: the unsafe code that passes review and ships quietly until real users hit it.
- **Shipped LLM features.** Built recurring AEO (Answer Engine Optimization) jobs that query LLMs against every active SEO client website to measure AI search visibility.

Professional Experience

Software Engineer, Catalyst IQ (formerly Cloud Theory)

Nov 2021 – Oct 2026 | Remote | Multi-tenant automotive analytics SaaS; one of the first engineers on a team that grew to 20+

- **116 completed PRs and 837 commits (Sep 2024 – Sep 2026)** across C# backend services, REST APIs, background workers, SQL Server, and Blazor, MVC and TypeScript/JavaScript frontends.

- **Production incident response.** Root-caused an Azure App Service memory overflow to Newtonsoft buffering huge JSON payloads to a full temp drive; moved to System.Text.Json streaming plus API pagination. Rewrote a 17-second SQL stored procedure to use table partitions.
- **Fixed race conditions in async UI.** Hardened dealer search so late-arriving async results could no longer overwrite newer ones and select the wrong dealer.
- **Stabilized revenue workflows.** Fixed Discovery Quote submission, Enter-key misfires, broken integer entry and charts that never loaded; replaced a load-every-dealer query with scoped server reads and debounced seller search.
- **Google OAuth 2.0 and GA4 integration, solo, 13 PBIs.** Took it from POC through Google's formal app verification: Redis token cache, Azure Key Vault secrets, account pagination, policy pages and model tests. Zero regressions at launch.
- **MVC to Blazor modernization with parity.** Migrated Tenants, Subscriptions, Meta Ads, Amazon Setup, Client Onboarding and public flows without breaking routes, grids or authorization.
- **Built core products end to end.** Architected Strategy Builder, the company's core revenue product, and led its 2.0 rebuild; designed Health Score algorithms (0–100 scale, 7 weighted metrics) with configurable Competitive Sets; built the CatalystSEO product line solo.
- **Testing and code review.** Wrote unit and integration test suites, did daily code review in Azure DevOps and mentored 4 junior engineers.

Software Engineer I, Jack Henry & Associates

Jan 2018 – May 2021 | Springfield, MO

- Built and tested custom C#/.NET backend solutions for individual banking clients, deployed with no ongoing support burden.
- Built SQL tooling and data pipelines that cut client data errors by 20%.
- Turned ambiguous requirements from bank executives into precise, on-spec deliverables as the sole technical liaison.

iOS Engineering Intern, Banno (Jack Henry)

May 2016 – Jan 2018 | Springfield, MO

- Shipped features and critical bug fixes in Swift and Objective-C for a white-label iOS banking app used by hundreds of financial institutions.

Skills

- **AI code evaluation:** Claude Code, agentic coding, frontier models, red-teaming, AI code review, failure analysis, root-cause analysis, bug triage, LLM integration, technical writing
- **Languages:** C#, TypeScript, JavaScript, SQL, Python, HTML/CSS, Swift
- **Backend:** ASP.NET Core, REST APIs, background workers, OAuth 2.0, SQL Server, Redis

- **Frontend:** Blazor, ASP.NET MVC, React, Telerik and Kendo UI
- **Cloud and tooling:** Azure App Service, Azure Key Vault, Azure DevOps, Git, CI/CD
- **Practices:** Unit and integration testing, code review, debugging, production incident response, security and authorization review

Education and Certifications

- M.A. in Counseling (in progress), Northwestern University (Counseling@Northwestern), expected December 2028
- B.S. Computer Science, Missouri State University
- Microsoft Azure AI Fundamentals (AI-900), Microsoft, 2023
- Software Engineering Immersive, General Assembly, 2021
